REPOPILOT — PUBLIC PROMOTION & LAUNCH PLAYBOOK

Comprehensive Developer Marketing, Social Copy Templates & Community Distribution Strategy

KEY PROJECT METRICS & VERIFIED ASSETS

Live Production URL: https://repo-pilot-git.vercel.app
Official Repository: https://github.com/Mohit-Rocky-25/RepoPilot
Architecture: Next.js 14 App Router, WebGL 3D Graph, Mermaid SVG, Local Ollama Integration (Zero API Cost)

1. Executive Positioning & Core Value Proposition

Software engineers and open-source contributors spend up to 70% of their time reading existing code rather than writing new logic. When onboarding onto an unfamiliar codebase, engineers struggle with three distinct friction points:

- **1. Missing Entry Points:** Large mono-repos or deeply nested folder trees conceal where execution begins.
- **2. Invisible Couplings:** Tracing relations across API handlers, middleware, services, and models requires days of manual cognitive effort.
- **3. Hallucinating AI Tools:** Generic cloud chatbots fabricate non-existent APIs and hallucinate file paths because they lack deterministic grounding in the repository revision.

RepoPilot solves this with a clear, defensible position: "Understand any 10,000+ line codebase in 60 seconds with 3D/Mermaid maps, deterministic symbol search, and zero-token-cost local AI investigation."

2. The Elevator Pitches (Memorize & Deploy)

A. The 1-Line Hook (For Twitter Bios, Social Snippets, Community Intros)

"RepoPilot is an open-source developer platform that visualizes unfamiliar GitHub repos in 3D, searches symbols deterministically, and investigates bugs with local AI — with ¹0 / $0 cloud API costs."

B. The 30-Second Elevator Pitch (For Podcasters, Tech Leads, Hackathon Demos)

"Imagine pasting any GitHub URL and instantly getting an interactive 3D spatial graph of the codebase, automatic architecture role categorization, and a deterministic symbol table across TypeScript, Python, Go, and Rust. Even better, you can paste an ugly production stack trace and RepoPilot correlates the error frames with source lines and drafts candidate unified diffs. Best of all: it runs locally with Ollama, so zero private code leaves your machine and zero API bills are incurred."

3. Platform Launch Templates (Copy & Paste Ready)

Platform 1: Hacker News — "Show HN"

Hacker News is the highest-leverage developer channel globally. The audience values technical humility, zero marketing hype, architectural transparency, and privacy-respecting local-first software.

HACKER NEWS "SHOW HN" SUBMISSION

```
Title: Show HN: RepoPilot – Explore unfamiliar GitHub repos with 3D/Mermaid maps and local AI

URL: https://repo-pilot-git.vercel.app

Comment Text:
Hey HN,

I built RepoPilot (https://repo-pilot-git.vercel.app) to solve a personal pain point: jumping
into large, unfamiliar open-source codebases and having no clue where execution starts or how
modules connect.

Key technical capabilities:
- Interactive 3D spatial & Mermaid dependency maps: Visualize module coupling and entry points
before reading code.
- Deterministic AST symbol indexing: Regex and parser extraction across TS, JS, Python, Go, and
Rust without running heavy language server daemons.
- Bug investigator & stack trace mapper: Paste a production error stack trace to correlate frames
with source files and draft candidate unified diffs.
- Zero API fees: Runs purely in-browser and connects to your local Ollama instance for grounded
explanations with verified citations (no private code sent to 3rd-party clouds).

Live web demo: https://repo-pilot-git.vercel.app
Source code: https://github.com/Mohit-Rocky-25/RepoPilot

Would love feedback on how you currently explore unfamiliar codebases and what features would
make your onboarding faster!
```

Platform 2: Reddit (r/opensource, r/webdev, r/SideProject, r/selfhosted)

Post natively with a 15-second screen recording showing you pasting a well-known repo (e.g. expressjs/express) and spinning the 3D graph.

REDDIT POST TEMPLATE (r/opensource & r/webdev)

```
Post Title: I built an open-source codebase intelligence tool with 3D architecture maps and zero
cloud API fees

Hey everyone!

Whenever I had to contribute to a new repository or onboard onto a complex project, I'd waste
hours clicking through directories just to understand how modules connect.

So I built RepoPilot: https://repo-pilot-git.vercel.app
GitHub: https://github.com/Mohit-Rocky-25/RepoPilot

What it does:
1. Paste any public GitHub repo URL.
2. Pins the exact commit SHA so references never drift or break.
3. Automatically generates 3D spatial graphs & Mermaid architecture diagrams.
4. Deterministic AST symbol search (functions, classes, interfaces).
5. Paste an error stack trace -> it maps frames to source lines and drafts candidate patch diffs.
6. Connects directly to local Ollama (Llama 3 / CodeLlama) for explanation with zero API bills.

It's 100% free and open-source. Try pasting your favorite repo and let me know what you think!
```

Platform 3: Twitter / X (Viral Video Thread)

Developers on X engage heavily with screen recordings of UI interactions and spatial visualizations.

TWITTER / X THREAD SPECIFICATION

```
[Tweet 1 - The Hook + 15s Video]
Entering an unfamiliar 10,000-line codebase is overwhelming.

I built RepoPilot — a free, open-source platform to understand any GitHub repo in seconds.

'( 3D interactive architecture graphs
Ø=ÜÊ Instant Mermaid diagrams
Ø=Ý  Deterministic AST symbol search
&¡ Local Ollama AI with  ¹0 cloud bills

Try it live: https://repo-pilot-git.vercel.app
GitHub: https://github.com/Mohit-Rocky-25/RepoPilot

[Tweet 2 - How it works]
Most AI code tools hallucinate non-existent files. RepoPilot is deterministic-first:
1. Pins exact Git commit SHAs
2. Extracts symbols via fast AST parser
3. Maps production error stack traces to candidate PR diffs

[Tweet 3 - Privacy]
Zero code is sent to 3rd-party clouds. Connects directly to your local Ollama daemon.
If you find it useful, drop a star on GitHub +P https://github.com/Mohit-Rocky-25/RepoPilot
```

Platform 4: LinkedIn (Professional Engineering Audience)

Frame the post around engineering productivity, onboarding velocity, and open-source contribution friction.

LINKEDIN POST TEMPLATE

```
Software engineers spend up to 70% of their time reading existing code rather than writing new
code.

When onboarding onto a new team or contributing to open source, the hardest part is understanding
how modules connect and where entry points live.

To help solve this, I built RepoPilot — an open-source codebase intelligence platform:
Ø=ÜI Live App: https://repo-pilot-git.vercel.app
Ø=ÜI GitHub: https://github.com/Mohit-Rocky-25/RepoPilot

What it offers:
• Visual 3D & Mermaid architectural dependency mapping
• Deterministic AST symbol extraction across TS, Python, Go & Rust
• Stack trace debugging: map production error logs to candidate PR diffs
• Privacy-first local AI integration (Ollama) with verified file citations

Check it out and let me know what you think! If you find it useful, feel free to star the repo on
GitHub +P
```

Platform 5: Product Hunt Launch Spec

Prepare your Product Hunt launch page with these concise assets:

- **Tagline:** Understand any GitHub codebase in seconds with 3D maps and local AI
- **Pricing:** Free / Open-Source (MIT License)
- **Topics:** Developer Tools, Open Source, Artificial Intelligence, Web Development

4. 20-Second Demo Video Script (The Key to Virality)

A silent 15–20 second screen capture GIF or video will outperform long text explanations by 10x across Twitter, LinkedIn, and Reddit:

• **Second 00–04:** Show browser open on RepoPilot home screen. Paste `https://github.com/expressjs/express` and click "Begin Exploration".

• **Second 05–09:** Screen transitions to the 3D Interactive Spatial Architecture Graph. Drag mouse to spin the graph nodes in 3D space.

• **Second 10–13:** Switch tabs to the Mermaid Architecture diagram view. Zoom in on clean module relationships.

• **Second 14–17:** Click the "AST Symbol Search" tab. Type a function name (e.g., `Router`) and show instant line-number jumping.

• **Second 18–20:** End on the "Local AI / ¹0 API" badge and the link: `repo-pilot-git.vercel.app`.

5. The 3 Golden Rules for Maximum Developer Traction

• **1. Never Require an Account / Never Require Git Clone:** Developers leave instantly if forced to sign up with email. RepoPilot allows anyone to paste a repo URL and start exploring within 3 seconds. Always emphasize this friction-free access.

• **2. Highlight the Privacy / Zero-Cost Angle:** In a market saturated with expensive $20/month AI wrappers, RepoPilot stands out because it connects to local Ollama with ¹0 API costs. Emphasize data sovereignty and local inference.

• **3. Respond to Community Feedback Within 15 Minutes:** On Hacker News and Reddit, the algorithm rewards fast comment velocity. When someone asks a question or suggests a feature, reply immediately thanking them and linking to the source code.

6. Launch Day Timeline & Checklist

• **Hour 0 (09:00 AM EST):** Post "Show HN" on Hacker News. (Best days: Tuesday or Wednesday morning).

• **Hour 1 (10:00 AM EST):** Publish Twitter / X thread with 20-second video demo. Tag relevant open-source creators.

• **Hour 2 (11:00 AM EST):** Post in r/opensource and r/webdev on Reddit with the native video embed.

• **Hour 3 (12:00 PM EST):** Publish LinkedIn article / post focusing on onboarding productivity.

• **Day 2:** Publish in-depth technical tutorial on Dev.to and Hashnode detailing how the AST parser and 3D WebGL engine were built.

• **Day 3:** Submit PRs to popular curated GitHub lists (e.g. `awesome-developer-tools`, `awesome-nextjs`).
